Seed Mussel Survey Report for South Wicklow Head – 20/06/2019-24/06/2019

Vessel: MV T.Burke II (BIM), Skipper John Murphy, Survey Officers Nicolas Chopin, Adam Andrews.

Equipment: 1 meter dredge and 400 kHz side-scan sonar

Area surveyed: South Wicklow Head north of Ardmore Point

Survey summary:
This survey found what may be overwintered seed on ground identified as part of a seed bed in 2018. This resource is ready to be fished. A quantitative survey remains to be carried out. Only weak traces of newly settled seed were found in the surveyed locations.

- South Wicklow Head: A small proportion of the scattered settlement from 2018 appears to have overwintered. A total of 31 tows were made, where 6 contained dense aggregations of seed (25-45 mm) covering an area of approximately 90 hectares. This resource is ready to be fished and is at risk of predation by starfish which were found in abundance towards the edges of the bed. Several tows contained traces of newly settled seed (~4 mm) on large stones, though this is unlikely to amount to a sizeable resource nor does it appear to be on suitable ground for fishing.

Bottom type: Mainly gravel with stones.

Recommendations:
A tonnage estimation of the overwintered seed remains to be carried out. Notwithstanding, the resource is at risk of predation and should be fished as soon as the fishery opens.

Notes for the map:

TW stands for Tow Wicklow
Table 1: Area coordinates (in Degrees, decimal minutes WGS84) from North to South:

- The settlement south of Wicklow Head is in a North/South orientation covering approximately 90 hectares
